

The Problem:

High-quality function textiles and clothing, like e.g. Rukka require special care. Increased soiling reduces the permeability of climatic membranes. Common detergents and fabric softeners can impair the climate membranes' function and the effectivity of water-repellents.

The Solution:

TECHNICAL FABRIC & LEATHER WASH

Product Advantages:

Excellent cleaning performance; restores the breathability of climate membranes!

- Fluid special detergent for functional clothing
- Prepares the clothing fibre optimally for absorbing the water-repellent

("Motorradfahrer" (special-interest magazine for motorcyclists))
"No residuals were found for the sugar mixture and used oil stains.
The cleaner also achieved best results for chain grease..."

Applications:

All functional textiles, leather or textile-leather combinations
(Please note the manufacturer's care instructions)

How to apply:

Dosage:

water hardness	For light to normal soiling	
	 light	 normal
1 = soft	50 ml	60 ml
2 = medium	60 ml	75 ml
3/4 = hard/very hard	75 ml	85 ml

Please remove the protectors before washing.

Machine washing instructions: Pour S100 Technical Fabric & Leather Wash into the washing bowl (see chart for dosage), put the latter into the washing drum and wash according to the manufacturer's instructions. S100 Technical Fabric & Leather Wash can also be applied directly on highly soiled areas before washing. Select an additional rinsing step, if possible. Do not wash more than 2 pieces of clothing simultaneously.

Manual washing instructions: Put the corresponding amount of S100 Technical Fabric & Leather Wash into lukewarm water and wash the clothing thoroughly. S100 Technical Fabric & Leather Wash can also be applied directly on highly soiled areas before washing. Rinse thoroughly (preferably 3 times) with lukewarm water afterwards.

Contains 5 washes at low water hardness and light soiling

Tip:

Note: If you plan to impregnate the clothing afterwards, do not use any fabric softener.

- Leather must dry thoroughly after washing. Dry leather by hanging it up in a dry and well-ventilated place. Never dry leather on a radiator or in extreme direct sunlight in order to avoid excessive dry-out.
- The leather must be provided with new fat and nutrients after cleaning in order to keep it soft and prevent water and dirt from penetrating the material. We recommend using the S100 Leather Care.
- Textiles must be impregnated in order to prevent them from soaking, soiling and bleaching. We recommend S100 Waterproofing Agent.
- Membrane clothing should be cleaned more frequently, as increased soiling reduces the breathability.
