

The Problem:

If you have ever been surprised by a heavy rain shower, you know how important waterproofed textiles and leather items (jacket, trousers or shoes) are. Even the outer fabric of waterproof membrane clothing is fully absorbed with water and causes unpleasant evaporative cooling. Your body cools down and you have the feeling of being wet. It also significantly reduces the membrane's breathability.

The Solution:

F100[®]

Waterproofing- Agent

Product Advantages:

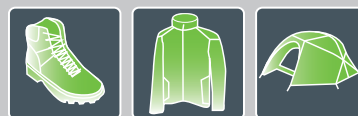

Extra strong protection from wetness and evaporative cooling

- Long-lasting effectiveness
- Protects item from getting fully absorbed with water and therefore from evaporative cooling
- Maintains breathability of climate membranes (e.g. Gore-Tex, Sympatex)
- Suitable for textiles and leather
- Protects from fading through UV radiation
- Water, oil and dirt-repellent
- No staining

Applications:

All textiles and leathers

- Functional clothing
- Shoes
- Tents
- Rucksacks
- Ski clothing
- etc.

How to apply:

Before waterproofing, we recommend a thorough wash with F100 functional detergent in order to prepare the textile fibre for absorbing the waterproofing agent. Shake can well before use. Apply product evenly onto dry and clean fabric only in well-ventilated areas, ideally outdoors, from approx. 20 cm distance and not too moist. Allow to dry away from sunlight. **Do not use in bright sunlight or on heated surfaces.**

Tip:

Tip to improve waterproofing effect:

The waterproofing effect can be improved through subsequent heat treatment once item is fully dry, e.g. by hanging up textiles in the sun or using a hairdrier. Please observe manufacturer's care instructions.
